Responsible AI at Work

Think Before You Prompt

The Everyday Shortcut

Generative AI can help you summarize documents, organize ideas, and save valuable time. But what happens when the information you're working with is confidential?

In this short learning experience, you'll explore a realistic workplace scenario and discover how to make safer decisions when using AI at work.

info

Your Challenge

By the end of this experience, you'll be able to identify risks associated with sharing sensitive business information with unapproved AI tools and choose a safer course of action.

Just One Prompt

Meet Alex, a professional facing a tight deadline and a familiar temptation: using AI to finish a task faster.
Watch what happens when a simple shortcut involves confidential business information.
Before watching: pay attention to the information Alex is preparing to share. You'll need to make a decision when the video ends.

Video URL — paste the complete YouTube or Vimeo link	https://youtu.be/W_CJZ0XUMmA
Caption — optional; leave blank if you do not want to display one	Enter the video caption...

What Would You Do?

Alex is about to make a decision that could put confidential business information at risk.
Think about the types of data involved, the potential consequences of sharing them, and the responsibilities employees have when using AI tools at work.
Choose the action you believe is most appropriate.

Quiz type — use "single" for single answer or "multiple" for multiple answers.	single

Question	**Alex is about to use a public AI chatbot to summarize an internal client report. What should Alex do?**
Option	Paste the complete report into the chatbot to save time.
Option	Remove employee names and submit the remaining information.
Option	Check company policy, use an approved AI tool, and share only necessary, permitted information.
Correct feedback	Correct! Responsible AI use starts with verifying which tools are authorized and understanding what information can be shared. Even approved tools may have restrictions on sensitive data.
Incorrect feedback	Not quite. Sharing confidential information with an unapproved AI tool can create security and privacy risks. Simply removing employee names may not eliminate sensitive client information, financial data, or internal project details. Before sharing any information, verify which tools are approved and what data they are permitted to process.
Alex's situation highlights an important lesson: even a simple request can become a security risk when sensitive information is involved. Before using generative AI at work, remember three practical steps.	

Pause. Check. Prompt.

Using generative AI responsibly doesn't have to be complicated. Building a few simple habits into your daily workflow can help you make safer decisions without sacrificing productivity.
Explore the three cards below to discover a practical approach you can apply before sharing information with an AI tool.

PAUSE	
Before sharing, take a moment to identify potential risks.	[N]
PAUSE	

Review the information you're planning to use. Does it contain client details, financial data, personal information, internal strategies, or other confidential content? If you're unsure whether the information is sensitive, don't submit it until you've checked.	**[N]**
CHECK	
Make sure you're using the right tool.	**[N]**
CHECK	
Verify which AI tools are approved by your organization and what types of information they are permitted to process. An approved tool does not automatically mean every kind of data is safe to share.	**[N]**
PROMPT	
Share only what's necessary and permitted.	**[N]**
PROMPT	
Once you've confirmed that the tool and information are authorized, minimize the amount of data included in your prompt. When appropriate, use generic examples or non-sensitive information instead of confidential business records.	**[N]**

tip
The Takeaway
AI can help you work faster. Good judgment helps you work safely. Before your next prompt, remember: **Pause. Check. Prompt.** Protecting sensitive information is part of using AI responsibly.

That's it!

You've completed this short learning experience!
The next time you use generative AI at work, take a moment to consider not only what the tool can do, but also what information you're allowing it to access.
Small decisions can make a big difference in protecting your organization, your clients, and their information.
